SCAMMER REPORTS SYSTEM

Abstract

Artificial Intelligence (AI) is increasingly transforming the education sector by enhancing learning support systems, improving student engagement, and enabling data-driven academic decision-making. With the growing need for secure, interactive, and personalized learning environments, AI-based platforms are becoming essential in modern academic systems. This project presents a **Scammer Reports System**, an integrated AI-driven educational support platform designed to improve learning experiences, academic monitoring, and information reliability within student communities.

The proposed system consists of **three primary modules: Admin, Staff, and Students**, each with clearly defined functionalities. A central component of the system is an **AI-powered chatbot** that enables natural and interactive communication between students and the platform. The chatbot is designed to analyse and understand **study materials uploaded by staff members**, such as notes and reference documents, and respond to student queries strictly based on this academic content. This ensures accurate, syllabus-oriented assistance and reduces misinformation.

Another important feature of the system is its ability to support **content verification and scam awareness using ML**. Students can share study-related links with peers; however, before these links are made visible, the system use ML model to automatically evaluates them to ensure they are genuine, safe, and relevant to academic purposes. This mechanism helps prevent the spread of scam-related, misleading, or non-educational content within the learning environment.

The Admin module manages overall system operations, including user management, content moderation, report handling, and monitoring of reported scam-related activities. The Staff module focuses on uploading study materials,

guiding students academically, and reviewing student interactions. The Student module provides access to learning resources, chatbot-based academic assistance, educational link sharing, and scam reporting features.

Developed using modern web and AI technologies such as **Python (Django), Flutter, MySQL, and contemporary frontend frameworks**, the system offers secure, role-based access and scalable performance. By integrating intelligent content analysis, academic assistance, and controlled information sharing, the proposed Scammer Reports System provides a holistic solution that enhances educational quality, promotes digital safety, and improves learning outcomes.

Existing System

In the existing academic support and learning systems, students primarily depend on traditional Learning Management Systems (LMS), classroom interactions, and external online resources for study materials and doubt clarification. Most current systems allow staff to upload notes and students to download them; however, **there is no intelligent mechanism to analyse these materials and provide automated, context-aware academic assistance**.

Students often rely on general-purpose search engines or unverified online platforms to clarify doubts, which increases the risk of exposure to **misleading, irrelevant, or scam-related content**. Existing systems also lack effective control over educational link sharing among students, allowing non-academic or unsafe links to circulate without validation. As a result, students may unknowingly access fraudulent websites or low-quality study resources.

Furthermore, traditional systems provide **limited interaction and monitoring capabilities** for administrators. Scam-related reports or suspicious activities are usually handled manually, if at all, making the process inefficient and inconsistent. There is no centralized mechanism to track reported content,

validate shared resources, or ensure the academic relevance and safety of information exchanged within the platform.

Overall, the existing system is **static, non-intelligent, and weak in content verification**, offering minimal academic guidance, poor protection against scams, and limited support for collaborative yet secure learning environments.

Proposed System

The proposed **Scammer Reports System** introduces an intelligent, secure, and interactive academic support platform that overcomes the limitations of existing systems. The system is designed with **three major modules: Admin, Staff, and Students**, ensuring role-based access, controlled data flow, and efficient system management.

A key feature of the proposed system is the **AI-powered chatbot integrated with academic content analysis**. Staff members upload study materials such as notes, documents, and reference files into the system. The chatbot processes and understands this uploaded content and provides **accurate, context-based answers** to student queries strictly derived from the staff-provided materials. This ensures reliable academic assistance while minimizing misinformation and dependency on external, unverified sources.

The system also incorporates a **secure educational link-sharing mechanism**. Students are allowed to submit study-related links, which are automatically analyzed and validated by the system. Only links that are verified as genuine, safe, and relevant to educational content are approved and made visible to other students. This feature prevents the circulation of scam-related, malicious, or non-academic links and promotes a safe collaborative learning environment.

The Admin module oversees complete system operations, including user management, content moderation, scam report handling, and monitoring system activities. The Staff module focuses on uploading learning materials, guiding students academically, and reviewing interactions. The Student module provides access to learning resources, chatbot-based academic support, verified link sharing, and scam reporting functionality.

1. Admin Module

The Admin module is responsible for overall system control and management. It ensures proper functioning, content moderation, and monitoring of user activities.

Functionalities:

- Admin Login
- Manage Students: View and manage registered student accounts
- Manage Staff: View and manage staff details
- Manage Departments and Courses
- Monitor Uploaded Study Materials
- Review and Manage Shared Study Links
- Handle Scam Reports: View reported suspicious or scam-related content
- System Monitoring: Track system usage and activities
- Change Password

2. Staff Module

The Staff module focuses on academic content management and student guidance. Staff members play a key role in providing verified learning materials.

Functionalities:

- Staff Registration and Login
- Profile Management
- Upload Study Materials: Notes, documents, reference resources
- Update or Delete Uploaded Content
- Academic Guidance Support
- View Student Interactions and Queries
- Content-Based Chatbot Integration: Uploaded notes are used by the chatbot to answer student questions
- Monitor Student Participation
- Change Password

3. Student Module

The Student module provides access to learning resources, academic assistance, and secure collaboration among students.

Functionalities:

- Student Registration and Login
- Profile Update

- Access Study Materials Uploaded by Staff
- Chatbot-Based Academic Assistance (answers derived from staff-uploaded notes)
- Share Educational Links
- Link Validation System: Only verified and genuine study-related links are visible
- View Shared Educational Links
- Change Password

Hardware and Software Requirements

The following specifications represent the minimum hardware and software requirements necessary for the effective and efficient operation of the **Scammer Reports System**. Adequate system resources are essential to ensure smooth processing, reliable performance, and scalability of the application.

Hardware Requirements

The selection of appropriate hardware is critical for the successful deployment and functioning of the system.

- **Processor** : Intel Pentium or higher
- **RAM** : 4 GB or more
- **Storage** : 40 GB hard disk or higher
- **Monitor** : LED display

- **Keyboard** : Windows-compatible keyboard
- **Mouse** : Windows-compatible mouse

Software Requirements

Proper software selection ensures system stability, security, and ease of development.

- **Operating System** : Windows 8 or above
- **Database** : MySQL
- **Backend** : Python (Django)
- **Frontend** : HTML, CSS, Bootstrap, JavaScript, Flutter
- **IDE / Tools** : PyCharm Community Edition, Android Studio
- **Web Browser** : Google Chrome, Microsoft Edge, Mozilla Firefox
